

# MF-RESILIENT ISOLATION CLIPS

MetroFlex Resilient Isolation Clips were designed to decouple drywall from wall or ceiling structures. MF-RIC clips are easy to install by simply being screwed to existing wood or steel stud/joists. Hat Channel is held in place by MF-RIC clips spread no more than 48" apart. Drywall is then installed on top of the hat channel by self drilling metal screws. MetroFlex Resilient Isolation Clips can reduce noise transfer between 75% and 100%. MetroFlex MF-RIC clips have been tested to be part of assemblies that have STC Ratings of up to 64!

## STACK METHOD

The Stack Method is the easiest way to install MetroFlex MF-RIC clips. Clips are stacked no more than 48" apart horizontally on the studs and the same stud location is used for all hat channel. Clips must be installed on both ends of the wall to ensure adequate support.

## STAGGERED METHOD

The Staggered Method is the most effective way to install MetroFlex MF-RIC clips, but uses more clips than the Stack Method. The same 48" max rule applies, but clips on the adjacent hat channel are not placed on the same stud as above or below. Simply move the clip one stud to the left of the clip above. Clips must be installed on both ends of the wall to ensure adequate support.
